DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1- are rejected under 35 U.S.C. 102(e) as being anticipated by Coughlin, Jr. et al. (2003/0146774).

5. Coughlin shows an output buffer apparatus (Fig. 4) comprising:

A power supply terminal (at PMOS source);

A ground terminal (at NMOS source);

An output terminal (PAD);

A main-buffer circuit including a plurality of P-channel MOS transistors (PMOSs) each connected between the power supply terminal and the output terminal and a plurality of N-channel MOS transistors (NMOSs) each connected between the ground terminal and the output terminal;

A first pre-buffer circuit (inverters connected to PMOSs) including a plurality of first pre-drivers each driving one of the P-channel MOS transistors in accordance with a data signal and a plurality of second pre-drivers (inverters connected to NMOSs) each driving one of the N-channel MOS transistors in accordance with the data signal;

A plurality of first D-type flip-flops (22 having inputs PVTP), each receiving a first impedance adjusting signal in synchronization (page 2, left col., third paragraph) with a falling edge of the data signal to turn ON one of the first pre-drivers (2, Fig. 5); and

A plurality of second D-type flip-flops (22 having inputs PVTN), each receiving a second impedance adjusting signal in synchronization with a rising edge of the data signal to turn ON one of the second pre-drivers (3, Fig. 5).

The limitations of claims 1-3 and 6 are rejected as above claim, furthermore, see the truth table of figure 5 for latching or holding update signal.

Allowable Subject Matter

3. Claims 4 and 7 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
